Summary

Computer Applications undergraduate focused on DevOps and Cloud Engineering, with hands-on experience building and deploying containerized applications on AWS. Developed CI/CD pipelines using GitHub Actions, Docker, Amazon ECR, EC2, IAM OIDC, AWS Systems Manager, and Secrets Manager. Built projects involving automated testing, infrastructure automation, and cloud deployment, with a focus on secure and repeatable delivery workflows.

Projects

Automated CI/CD Pipeline for React Portfolio Github Link

Tech Stack: GitHub Actions · AWS EC2 · Terraform · Nginx · AWS IAM OIDC · SSH

- Automated the build and deployment workflow using GitHub Actions, covering dependency installation, linting, production builds, and EC2 deployment.
- Provisioned EC2 infrastructure and Nginx configuration with Terraform, maintaining cloud infrastructure as code.
- Integrated GitHub Actions with AWS IAM OIDC, eliminating the need for long lived AWS access keys in the CI/CD workflow.
- Automated deployment of the production build to EC2 and configured Nginx to serve the application through the public endpoint.
- Added deployment gates so production releases proceed only after successful linting and build validation.

Code2KT – AI Knowledge Transfer Generator Github Link

Tech Stack: Docker · GitHub Actions · AWS EC2 · Amazon ECR · IAM OIDC · SSM · Secrets Manager · Nginx · Terraform

- Developed an AI powered Knowledge Transfer generator that analyzes software projects and produces structured technical documentation.
- Containerized the FastAPI application with Docker and built a CI/CD workflow that runs automated tests, builds images, pushes releases to Amazon ECR, and deploys them to EC2.
- Implemented a 3-provider AI fallback chain using Gemini, Groq, and OpenRouter to improve resilience against temporary provider failures.
- Integrated GitHub Actions with AWS IAM OIDC and Systems Manager to automate secure, keyless deployments to EC2.
- Integrated AWS Secrets Manager for runtime AI credentials and configured Nginx as a reverse proxy for the production container.

Deploying a Node.js Application on AWS EC2 Medium Link

Tech Stack: AWS EC2 · IAM · Ubuntu Linux · Node.js · SSH · Linux · Security Groups

- Deployed a Node.js web application on an Ubuntu-based Amazon EC2 instance and made it accessible through the instance's public endpoint.
- Configured AWS IAM and SSH-based server access while managing application configuration through environment variables.
- Configured EC2 Security Groups to control inbound traffic and expose only the required application ports.
- Set up the Linux runtime environment and verified the application deployment end-to-end on AWS EC2.

Education

Jaypee Institute of Information Technology, Noida Jul 2023 – Jul 2026
Bachelor of Computer Applications (BCA)

Certifications

Git & GitHub Python GoFr Summer of Code 2025
